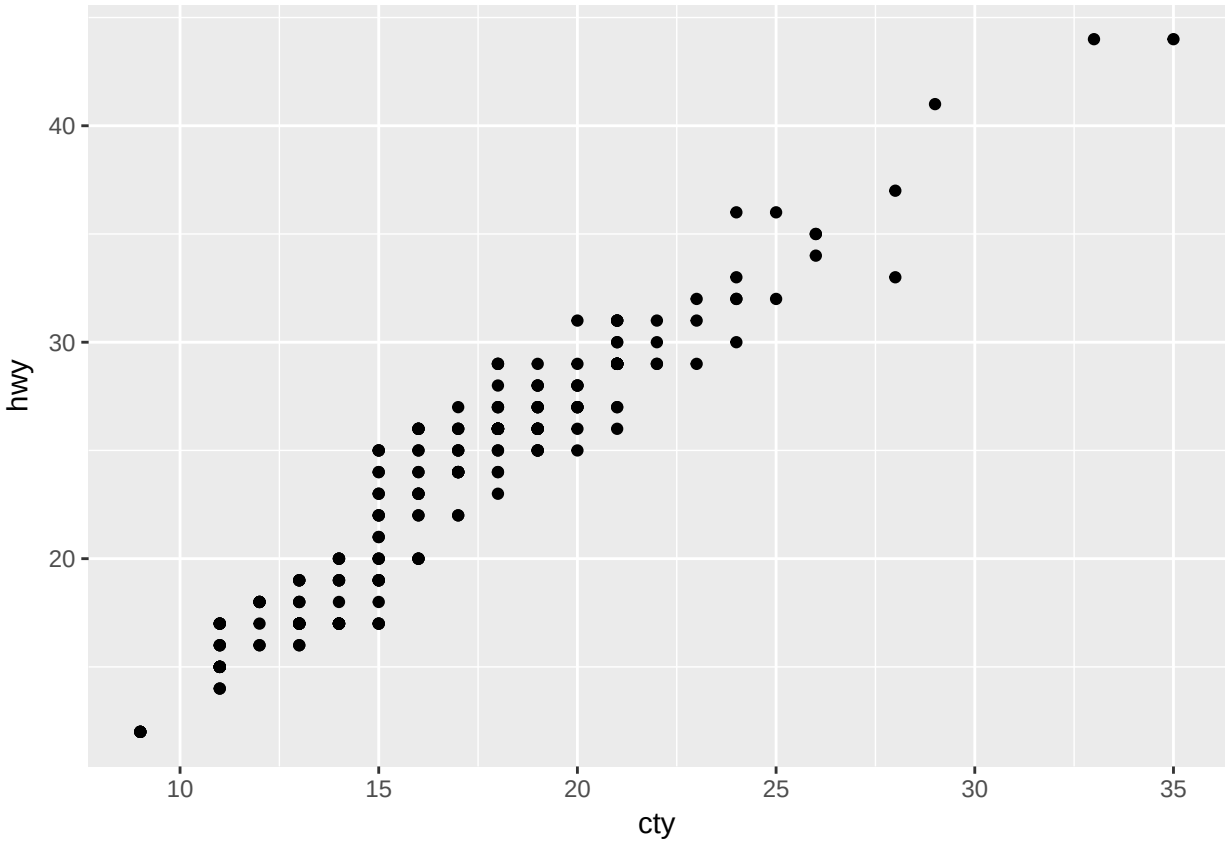
****My Github repository for my assignments can be found at below URL: (https://github.com/santumagic/compscix-415-2assignments.git)****

```
library(tidyverse)
library(mdsr)
```

Section 3.8.1: all excercises

QUESTION 1:

```
ggplot(data = mpg, mapping = aes(x = cty, y = hwy)) +
  geom_point()
```



ANSWER:

From the mpg dataset we know that cty and hwy both are continuous variables and when we plot them in a single plot, many data points will be overlapped especially for larger datasets. We can resolve this issue

(overplotting) by using adjustment to jitter with position = “jitter” or by using geom_jitter () as shown below.

ggplot(data = mpg, mapping = aes(x = cty, y = hwy)) + geom_point() + geom_jitter()

QUESTION 2:

ANSWER:

Lets find from the help function.

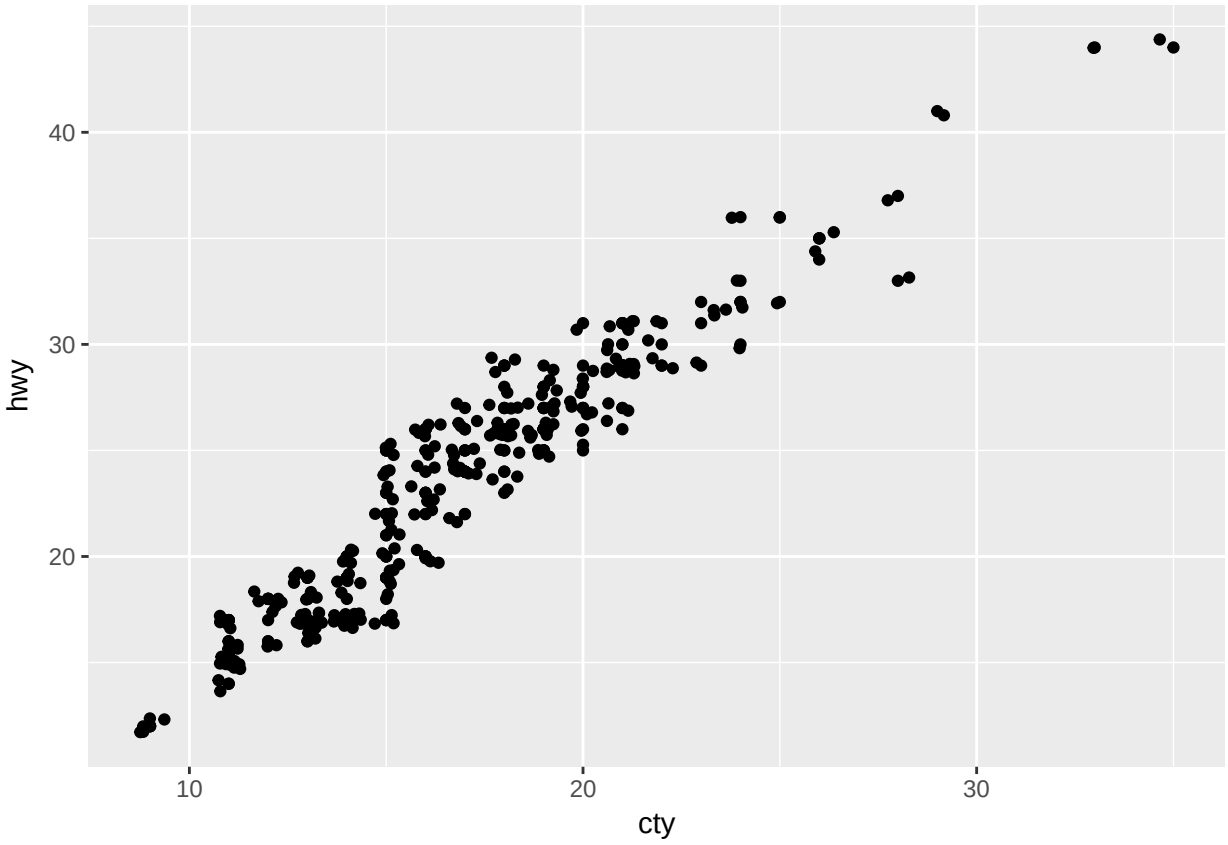
```
?geom_jitter
```

width and hight are the parameters that control the jittering.

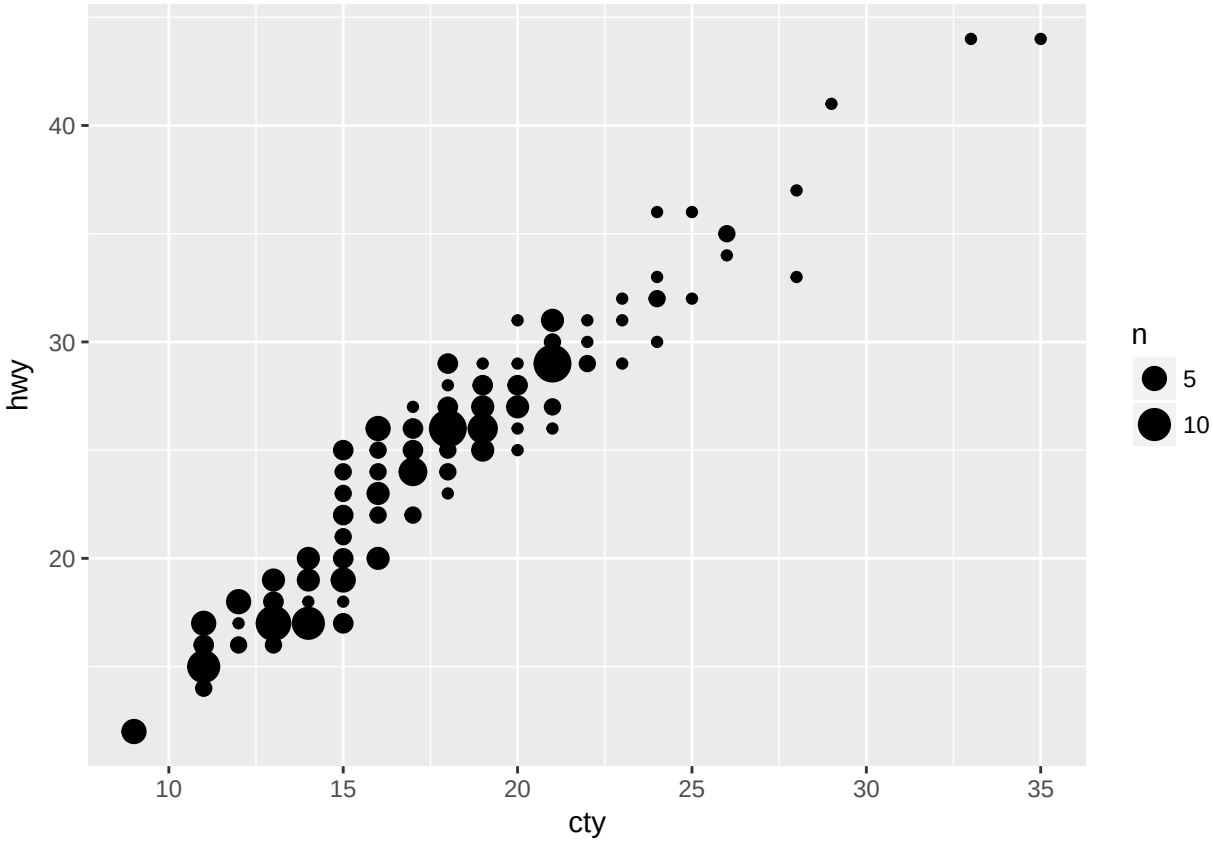
QUESTION 3:

ANSWER:

```
# geom_jitter()
ggplot(data = mpg, mapping = aes(x = cty, y = hwy)) +
  geom_point() +
  geom_jitter()
```



```
# geom_count()
ggplot(data = mpg, mapping = aes(x = cty, y = hwy)) +
  geom_point() +
  geom_count()
```



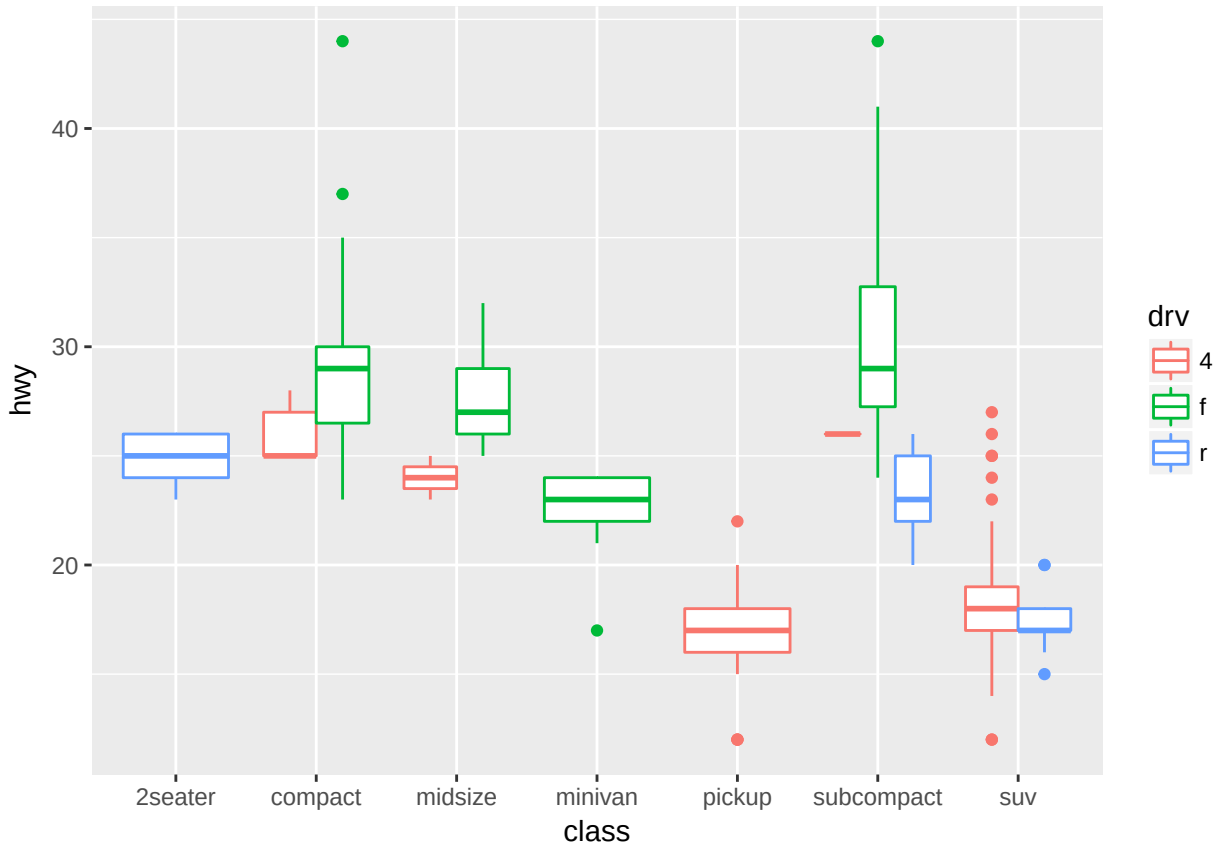
geom_count() is varient of geom_point and it basically it counts the number of data elements or observations at a point in the plot and then maps that count to the pointing area.

QUESTION 4:

ANSWER:

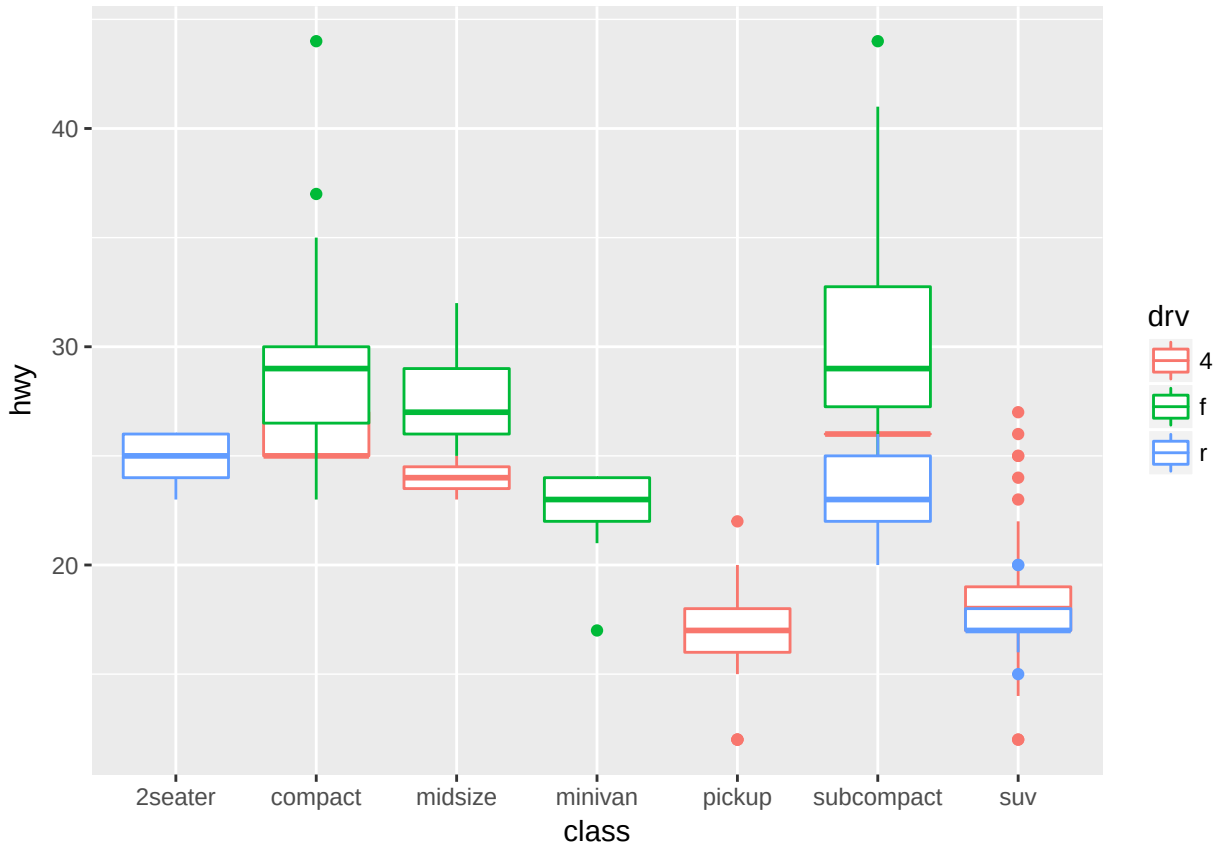
By observing all the below graphs, we can conclude that **position = "dodge"** is the default position adjustment for a boxplot.

```
ggplot(data = mpg, mapping = aes(x = class, y = hwy, color = drv)) +
  geom_boxplot()
```

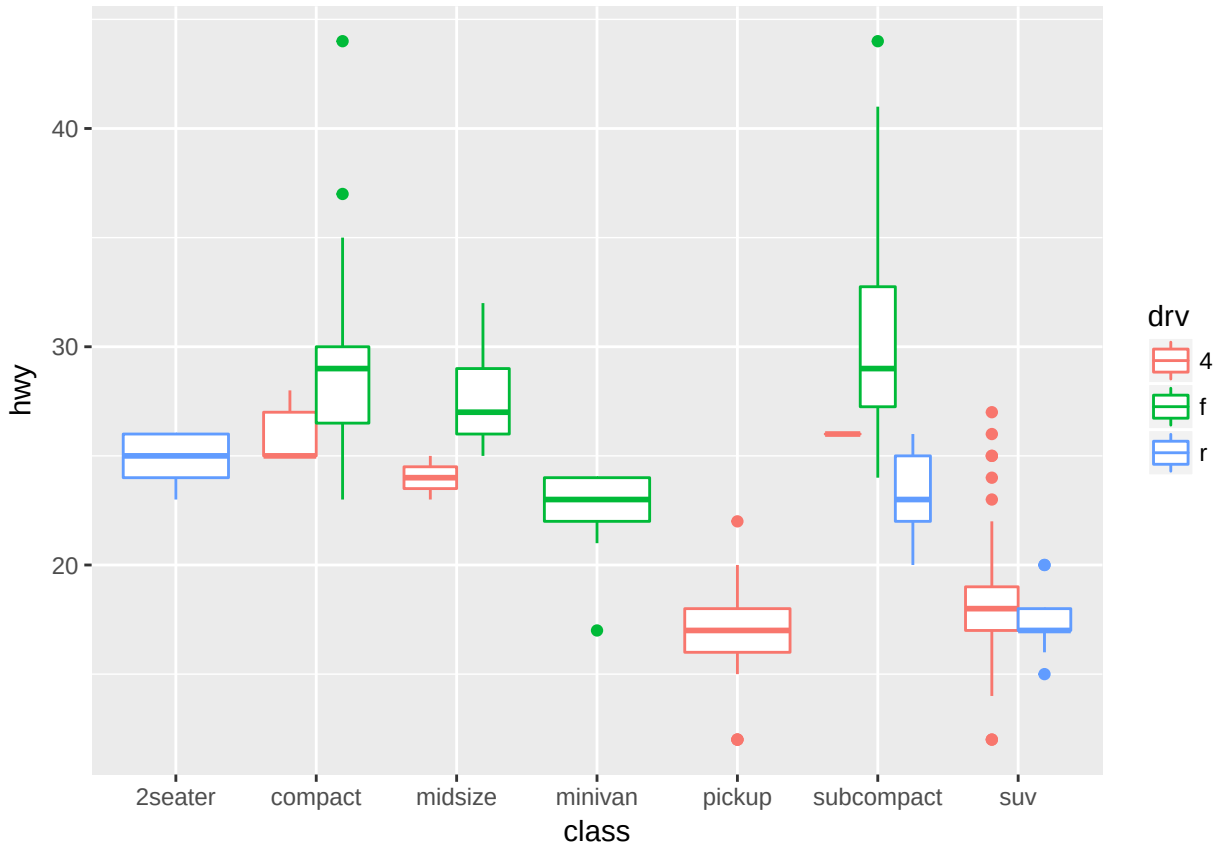


```
# lets try all types of position adjustments

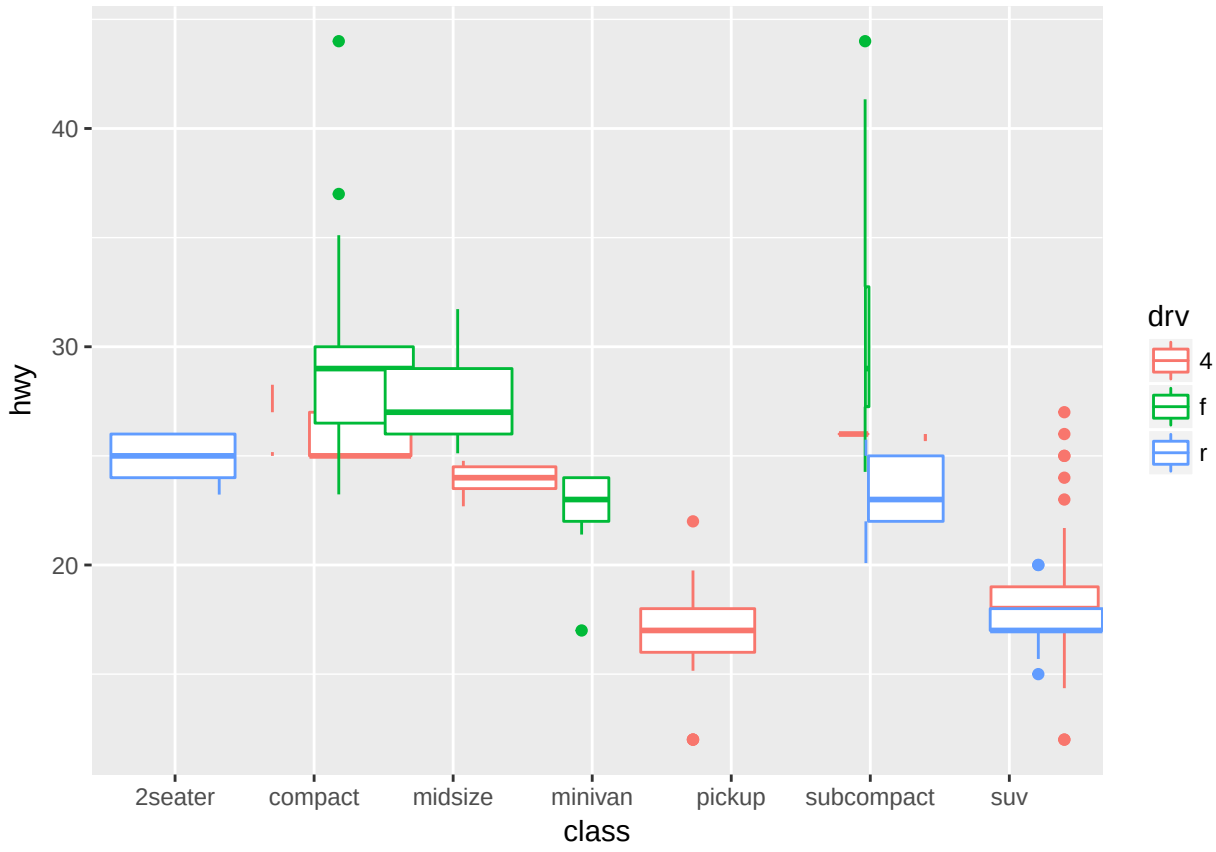
# position = "Identity"
ggplot(data = mpg, mapping = aes(x = class, y = hwy, color = drv)) +
  geom_boxplot(position = "Identity")
```



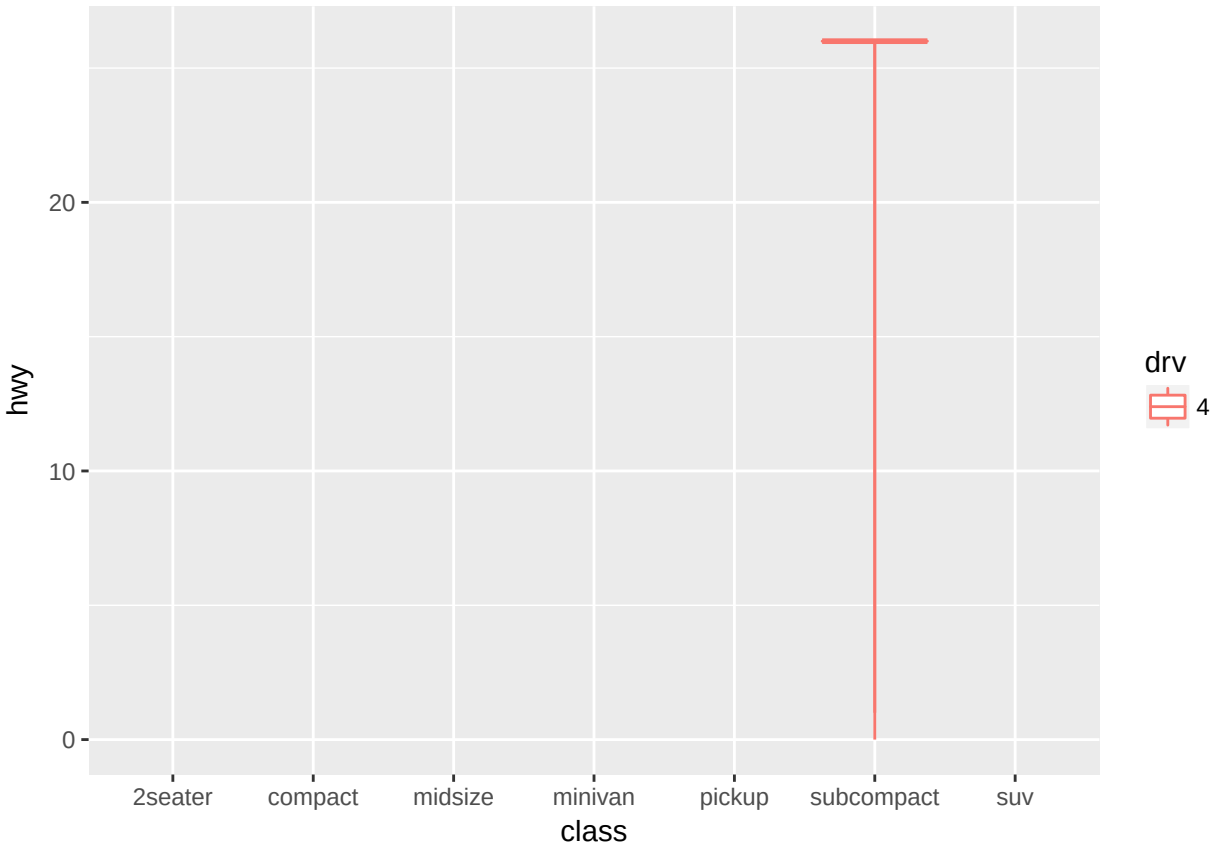
```
# position = "dodge"
ggplot(data = mpg, mapping = aes(x = class, y = hwy, color = drv)) +
  geom_boxplot (position = "dodge")
```



```
# position = "jitter"
ggplot(data = mpg, mapping = aes(x = class, y = hwy, color = drv)) +
  geom_boxplot (position = "jitter")
```



```
# position = "fill"
ggplot(data = mpg, mapping = aes(x = class, y = hwy, color = drv)) +
  geom_boxplot (position = "fill")
```



Section 3.9.1: #2 and #4 only

QUESTION 2:

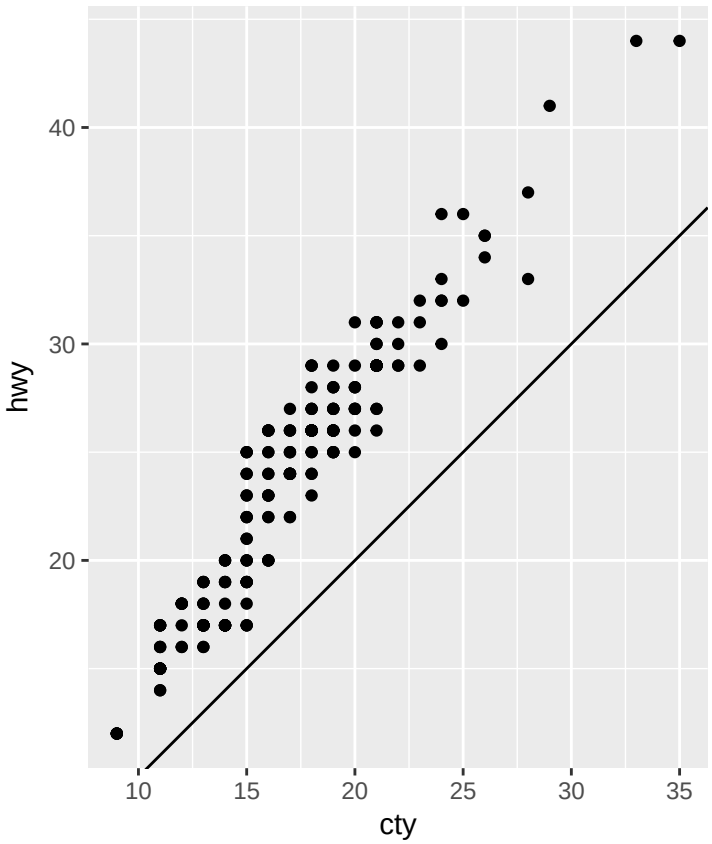
```
?labs ()
```

ANSWER:

labs will changes the lables for the axes. In addition we can use this for titles and substitles aswell.

QUESTION 4:

```
ggplot(data = mpg, mapping = aes(x = cty, y = hwy)) +
  geom_point() +
  geom_abline() +
  coord_fixed()
```



ANSWER:

– From the above graph it is observed that the both the variables are positively related to each other.
– coord_fixed is important because it is making sure that the coordinates for the both variables are fixed.
– geom_abline plots the slope between the variables cty and hwy.

Section 4.4: #1 and #2 only

QUESTION 1:

my_variable <- 10 my_var1able

ANSWER:

There is a type in the second line. It should be : my_variable

QUESTION 2:

ANSWER:

ggplot(data = mpg) + geom_point(mapping = aes(x =displ, y = hwy))

filter(mpg, cyl == 8)
filter(diamonds, carat > 3)

Data transformation

Section 5.2.4: #1, #3 and #4 only

```
#install.packages("nycflights13")

#library(nycflights13)
#library(tidyverse)
#library(mdsr)
```
